

Parts of a Django App

Models - provide structure for the database (nouns, classes)

Views - receive requests and generate responses (verbs, functions)

Urls - link address visited by a request and a view that is called

Templates - layout of pages that a user sees

Forms - provide interface in the browser for user to connect with the database

Settings - a list of variables and values used for configuration of the app

Admin - graphical interface that allows developer to interact with the database

Django commands to remember

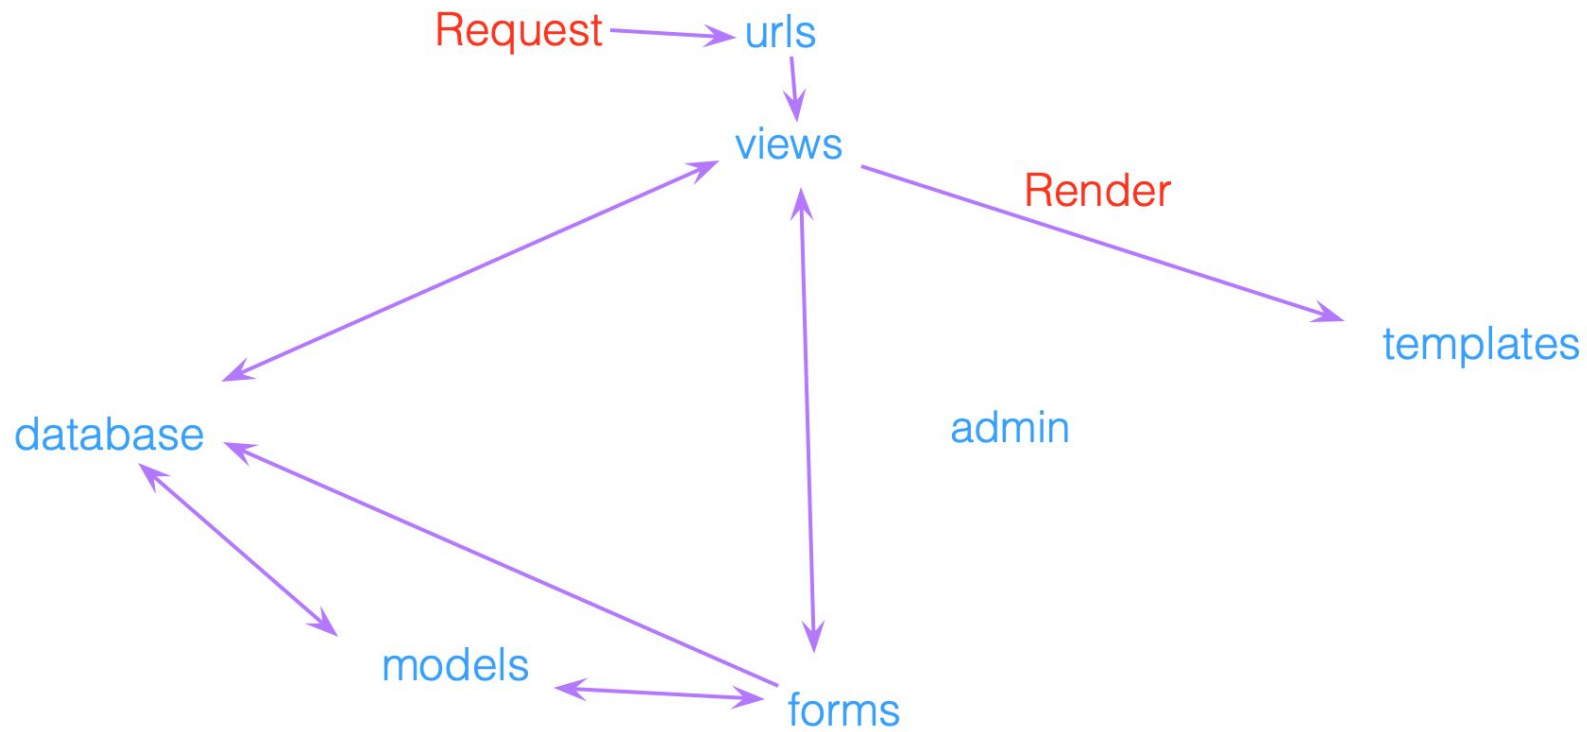

`django-admin startproject .` - starts Django project from scratch

`django-admin startapp <appname>` - creates a new app inside Django project

`python manage.py runserver` - starts local server

`python manage.py makemigrations` - checks for changes in Django models

`python manage.py migrate` - applies changes (migrations) to database

manage.py ?
